

Warmup: Determine the rule of the exponential function

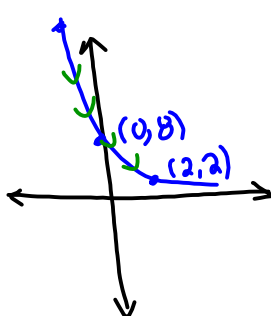

1.  $y = a(c)^x$   
 2.  $y = 8(\ )^x$

x	y
-2	32
0	8
2	2

$x=0$  ←  $a=8$   
 plug in x and y →

3.  $2 = \frac{8(c)^2}{8}$   
 $\sqrt{0.25} = \sqrt{c^2}$   
 $0.5 = c$  → less than 1

Answer:  $y = 8(0.5)^x$   
 y-int ↑  
 inc ↓  
 dec ↓

### A new function...

We will study a different function by making a table of values and graphing.

input ↓

$f(x) = x^2$

x	y
-2	4
-1	1
0	0
1	1
2	4

$f(-2) = (-2)^2 = 4$   
 $f(-1) = (-1)^2 = 1$   
 $f(0) = (0)^2 = 0$   
 $f(1) = (1)^2 = 1$   
 $f(2) = (2)^2 = 4$

Curve is called a "parabola"

The **Quadratic** or **Second-degree polynomial function**

Rule:  $f(x) = ax^2$

"a" is a value that affects how wide the parabola is, and whether it is facing up or down

thinner: a is large (bigger than 1)  
 wider: a is small (decimal)

Formula for finding "a":  $a = \frac{y}{x^2}$

Ex. A parabola passes through the point (3, 12).  
 What is the rule?

$y = ax^2$   
 $y = \frac{4}{3}x^2$   
 $a = \frac{12}{3^2} = \frac{12}{9} = \frac{4}{3}$  or  $1.\bar{3}$

Given $x, y$ Find $a$	Given $x, a$ Find $y$	Given $a, y$ Find $x$
$a = \frac{y}{x^2}$	$y = a \cdot x^2$	$x = \sqrt{\frac{y}{a}}$

Ex. Determine the rule of the quadratic function

$\rightarrow y = ax^2$   $a = \frac{y}{x^2}$

a) 

x	y
-2	8
0	0
2	8

 $y = 2x^2$

c)  $f(2) = 1$   $y = 0.25x^2$

*(Note: Red arrows point from 'x' to '2' and from 'y' to '1' in the equation above.)*

Given  $f(x) = -0.5x^2$

Determine...

a)  $f(4) = -0.5(4)^2 = -8$       b)  $f(10) = -0.5(10)^2 = -50$       c)  $f(-10) = -0.5(-10)^2 = -50$
